Best Practices for Morphine Use in Cancer Pain Management

Cancer-related pain is manageable! With proper treatment, 90-100% pain relief is possible. Follow these essential guidelines for the safe and effective use of morphine:

Morphine does not cause addiction when taken as prescribed, but your body may **need a higher dose** over time, which is normal.

Morphine can cause constipation. Take the laxative prescribed by your doctor regularly.

Get the medicine only from the hospital or medical team, as it is not available outside. Store it safely away from children and those who may misuse it.

Do not stop the medicine even if pain reduces; stop only on your doctor's advice.

Mild drowsiness, dizziness, nausea, or itching may occur initially but usually go away in a week. Do not stop the medicine because of these.

Do not share your medicine with others—it is illegal and unsafe.

Call your doctor immediately if:

- Pain is not well controlled
- You feel too drowsy
- You have severe constipation
- Your morphine stock is running low

Follow your doctor's advice for safe and effective pain relief.
